Task 1 — Grouping Icons in CorelDRAW

Note: Real app logos (Zomato, Swiggy, Uber Eats) are trademarked brand marks, so this exercise uses three original food-delivery-style icons of my own design — DineGo, ZoomBite and TakeEase — to demonstrate the exact same CorelDRAW Group workflow.

Step-by-step workflow

1. Draw or place the three icons on the page as separate objects — each has its own bounding box and selection handles.

2. Select all three: drag a marquee selection around them with the Pick Tool, or Shift+Click each icon one by one, or use Edit ▸ Select All ▸ Objects.

3. Group them: go to Object ▸ Group ▸ Group Objects, or simply press Ctrl+G. A single bounding box now surrounds all three icons.

4. Move the group: click and drag anywhere inside the bounding box — all three icons move together, keeping their relative positions.

5. Resize the group: drag any corner handle (hold Shift to resize proportionally from the centre, or Ctrl to constrain) — all three icons scale together as one unit.

6. To edit one icon inside the group without ungrouping, double-click it to enter the group, edit, then click outside or press Ctrl+Enter to exit. Use Ctrl+U to fully Ungroup if needed.

Step 1 — Three Separate (Ungrouped) Icons

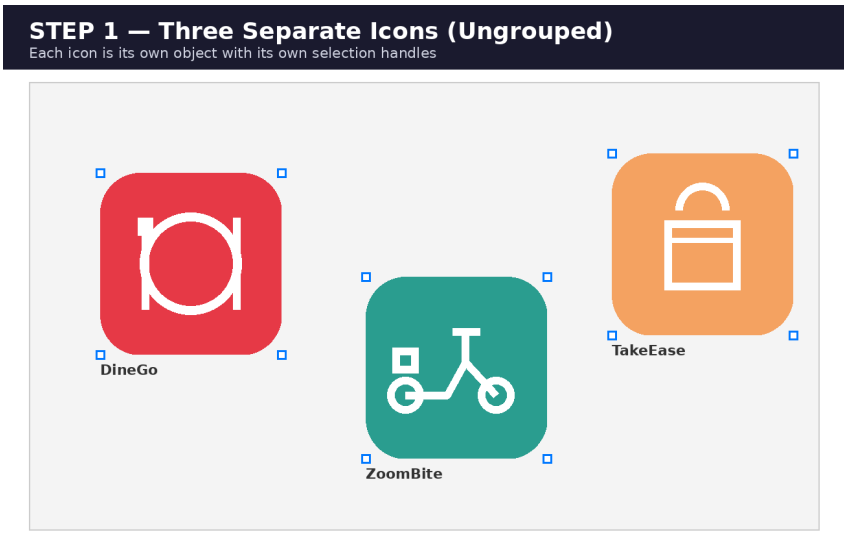

Fig 1.1 — Each icon has its own individual selection handles (blue squares) — they are independent objects.

Step 2 — Select All Three

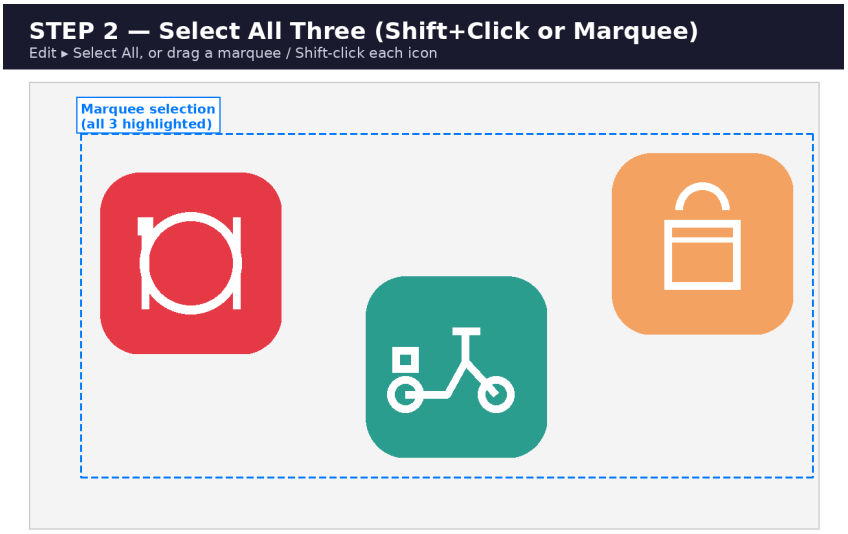

Fig 1.2 — A marquee selection (or Shift+Click) highlights all three icons at once, ready to group.

Step 3 — Group (Ctrl+G)

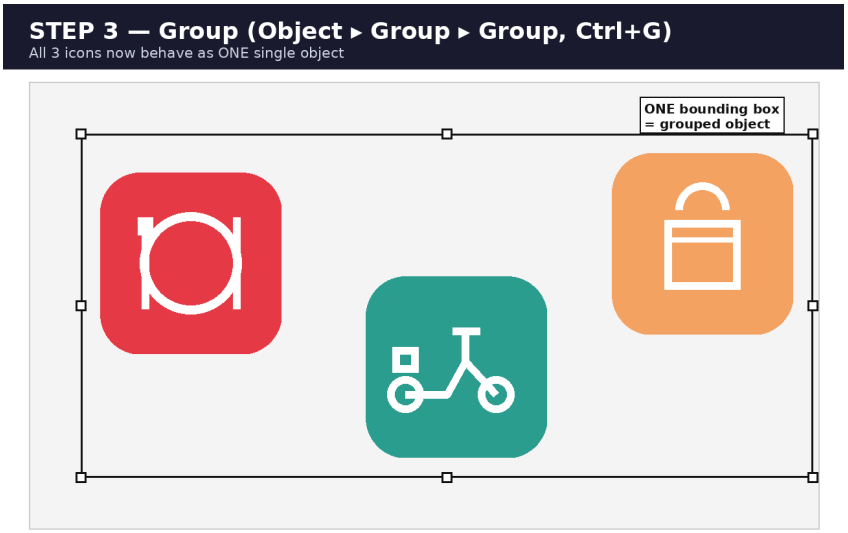

Fig 1.3 — After grouping, CorelDRAW shows ONE bounding box with one set of handles — the three icons now behave as a single object.

Step 4 — Move & Resize the Group Together

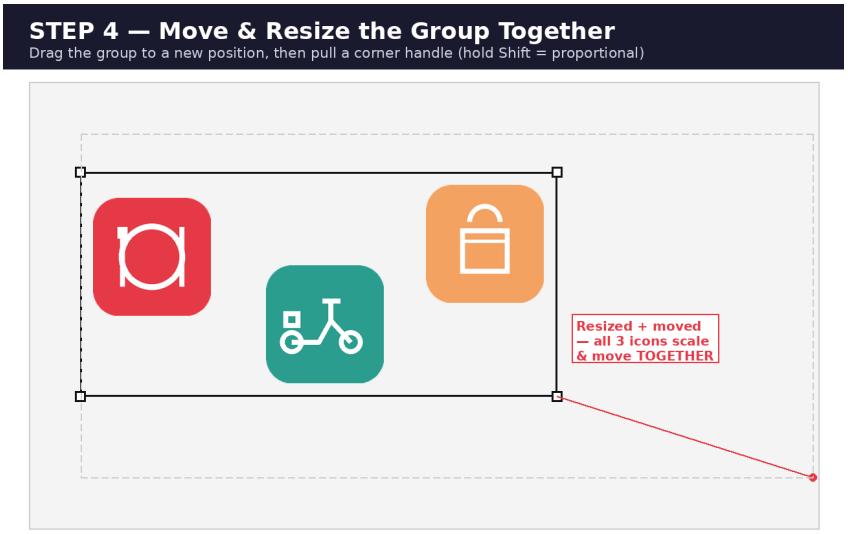

Fig 1.4 — Dragging the group to a new position and pulling a corner handle scales and moves all three icons together, preserving their relative layout.

Why grouping matters here

- Keeps the three app icons perfectly aligned to each other while you reposition them on a poster, UI mockup, or comparison slide.
- Prevents accidentally moving or resizing just one icon when the design needs all three treated as a single unit.
- Still allows double-click-to-edit access to any single icon inside the group without breaking the group.
