Movie Ticket Layout — Mixed Corner Rounding

Note: This uses an original ticket layout and a fictional movie ("Cosmic Raiders"), styled in the spirit of a BookMyShow-type ticket, rather than copying BookMyShow's actual branding or logo.

Step-by-step workflow

1. Draw the base ticket with the Rectangle tool — a plain rectangle with all four corners sharp (90°).
2. Add the layout content: a dark header strip for the movie title, a perforated divider line, a details block (date, time, screen, venue) on the left, and a QR/booking-ID stub on the right — exactly like a BookMyShow-style ticket.
3. Switch to the Shape Tool (F10). All four corner nodes of the rectangle become visible as small blue circles.
4. Click the top-left node, then hold Shift and click the bottom-right node — now only those two nodes are selected (shown highlighted in the diagram).
5. With just those two nodes selected, drag either one inward (or set a corner radius value in the Property Bar). Only the selected corners round off — the unselected top-right and bottom-left stay perfectly sharp.
6. Alternative: in the Property Bar's corner-radius fields, unlock the "all corners equal" chain-link icon, then type a radius only into the top-left and bottom-right boxes, leaving the other two at 0.

Step 1 — Base Ticket (All Sharp Corners)

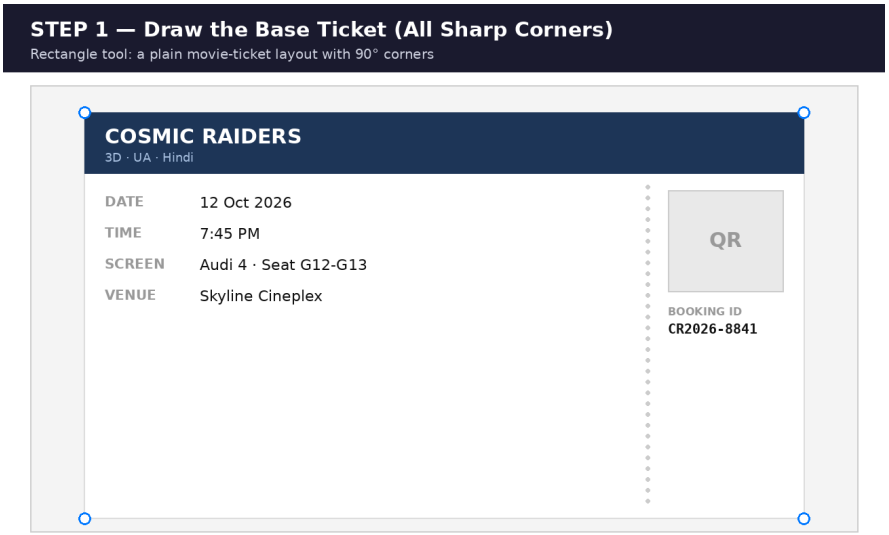

Fig 1 — Plain rectangle ticket with the 4 corner nodes visible via the Shape Tool, all still at 90°.

Step 2 — Select Only the TL and BR Nodes

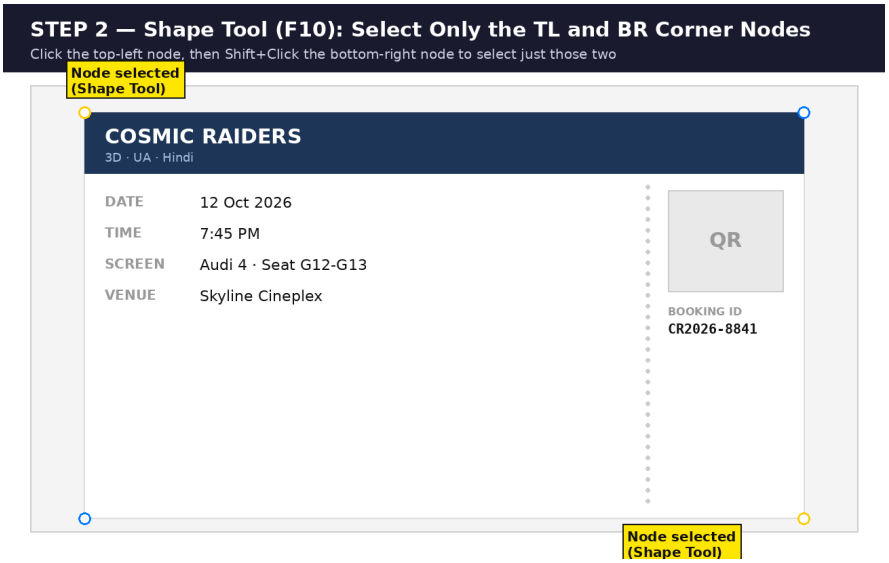

Fig 2 — Top-left and bottom-right nodes selected (yellow) using Shift+Click; top-right and bottom-left remain unselected (blue).

Step 3 — Round Only the Selected Corners

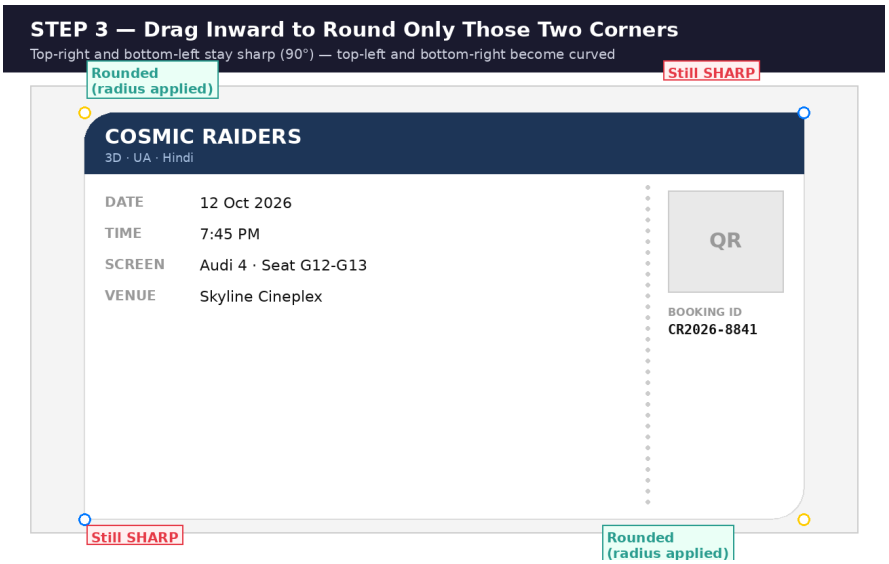

Fig 3 — Dragging the selected nodes inward rounds only the top-left and bottom-right corners; the other two stay sharp.

Final Ticket (Clean View)

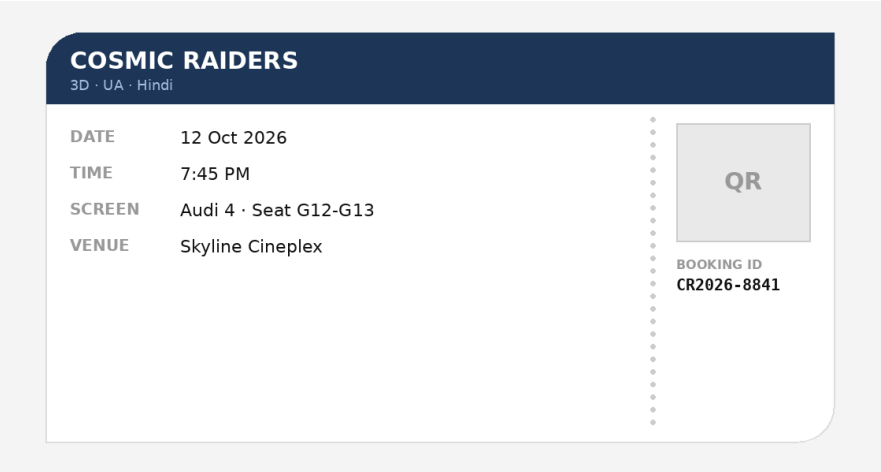

Fig 4 — The finished BookMyShow-style movie ticket with the custom asymmetric corner treatment.

Why this matters

- The Shape Tool's per-node selection is what makes CorelDRAW's corner rounding different from a simple "Corner Roundness" slider — it lets you round or sharpen each corner independently instead of all four at once.
- An asymmetric rounded-corner look (two soft, two sharp) is a common modern UI/print trick for tickets, cards, and badges — it gives a custom, less generic silhouette than a fully rounded or fully square rectangle.
- The same technique (Shape Tool ▸ select specific nodes ▸ drag or set radius) works on any rectangle, not just tickets — badges, ID cards, and app buttons can use it too.
