InDesign — Text Wrap Around a Stadium Image

Note: An original illustrated cricket stadium graphic is used here instead of a copyrighted stadium photograph, so the exact same Text Wrap workflow applies to any image you import via File ▸ Place.

Step-by-step workflow

1. File ▸ Place (Ctrl+D) and import the stadium image onto the page; position and size it where you want on the layout.

2. Draw a text frame with the Type tool and paste in the IPL match description. At this point the text frame and the image are two separate, unrelated objects — if they overlap, the text runs straight across the image, ignoring it completely.

3. Click the stadium image with the Selection tool to select it, then open Window ▸ Text Wrap to bring up the Text Wrap panel.

4. In the panel, click the second icon — "Wrap Around Bounding Box." This tells InDesign that any text frame behind or overlapping this image should flow around its rectangular bounds instead of running through it.

5. Set standoff values (Top/Bottom/Left/Right) in the same panel — e.g. 0.15 in top/bottom and 0.2 in left/right — to add breathing room between the image edge and the wrapped text.

6. The text frame automatically reflows: lines that pass beside the image shrink to the available column width, and once the text clears the bottom of the image, it resumes the full frame width.

Step 1 — Before: Text Overlapping the Image

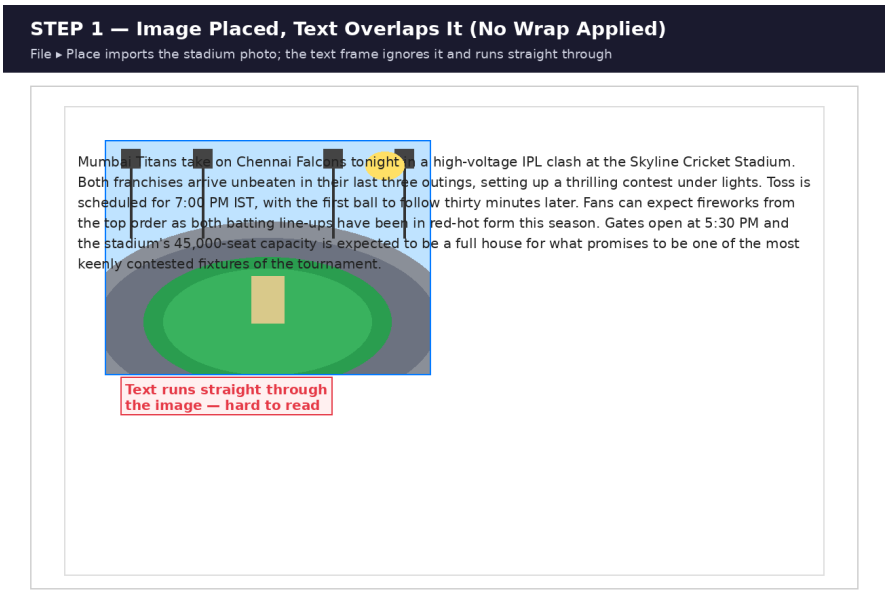

Fig 1 — With no Text Wrap applied, the IPL description runs straight through the stadium image, making both the text and the image hard to read.

Step 2 — Apply Wrap Around Bounding Box

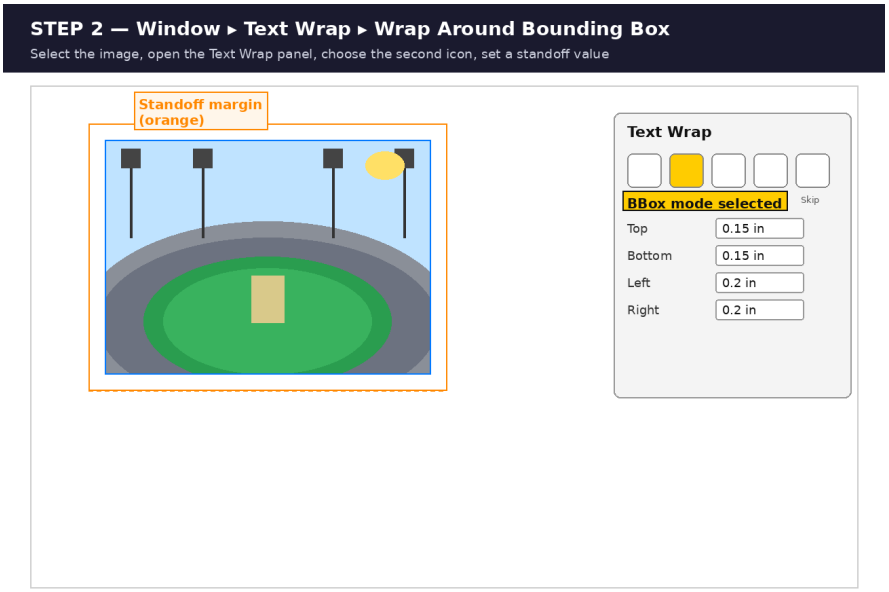

Fig 2 — The Text Wrap panel (Window ▸ Text Wrap), with the "Wrap Around Bounding Box" icon selected and standoff values set on all four sides.

Step 3 — After: Text Flowing Neatly Around the Image

Fig 3 — The same text now wraps into the narrower right-hand column beside the image, then returns to full width once it clears the image's bottom edge.

Why this matters

- Text Wrap keeps a layout readable when text and images share the same area, instead of forcing you to manually break the text frame into separate boxes.
- "Wrap Around Bounding Box" is the simplest option — it treats the image as its full rectangular frame. "Wrap Around Object Shape" would instead hug the actual visible silhouette of the image (useful for a cut-out photo on a transparent background).

- Standoff values control how much breathing room is left between the image and the surrounding text — too little looks cramped, too much wastes layout space.
