Arranging Overlapping Sneakers (Arrange ▸ Order)

Note: Real sneaker product photos from Flipkart/Myntra are copyrighted catalogue images, so this exercise uses three original sneaker-style icons of my own design (Sneaker A, B, C) to demonstrate the same Arrange > Order workflow.

Step-by-step workflow

1. Place three overlapping sneaker images on the canvas. By default, each new object you draw/import sits on top of the previous one, so the stacking order depends on the order you added them.

2. To bring your desired sneaker to the very top: select it, then go to Arrange ▸ Order ▸ To Front of Page (or To Front of Layer), shortcut Shift+PageUp / Ctrl+Home.

3. Other options in the same Arrange ▸ Order submenu: Forward One (move up a single level), Back One (move down a single level), and To Back of Page/Layer.

4. To send that same sneaker to the back: select it again, go to Arrange ▸ Order ▸ To Back of Page (or To Back of Layer), shortcut Shift+PageDown / Ctrl+End.

5. Verify the change visually — the sneaker that was sent to back should now be mostly covered by the other two, confirming the stacking order actually changed. You can also check the Object Manager docker (Window ▸ Dockers ▸ Object Manager), which lists every object top-to-bottom in its current z-order.

Step 1 — Initial Overlapping Stack

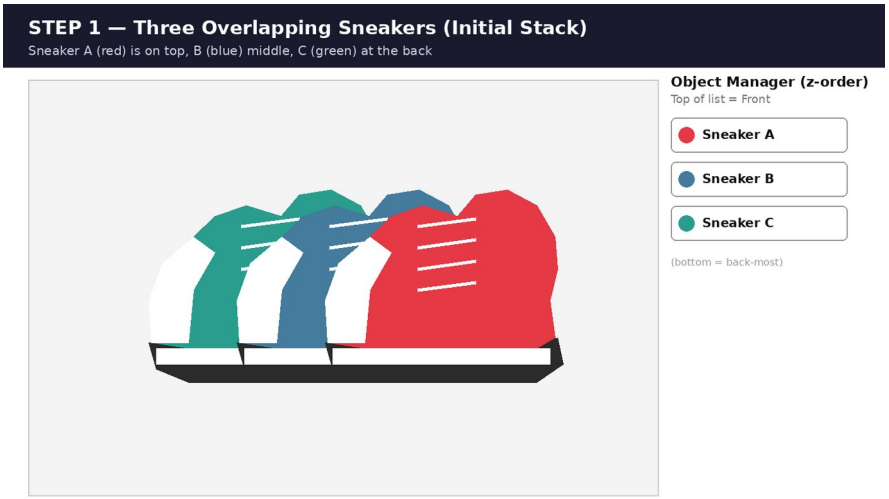

Fig 1 — Sneaker A (red) on top, B (blue) in the middle, C (green) at the back, with the Object Manager list matching the visual order.

Step 2 — Bring Sneaker C to the Front

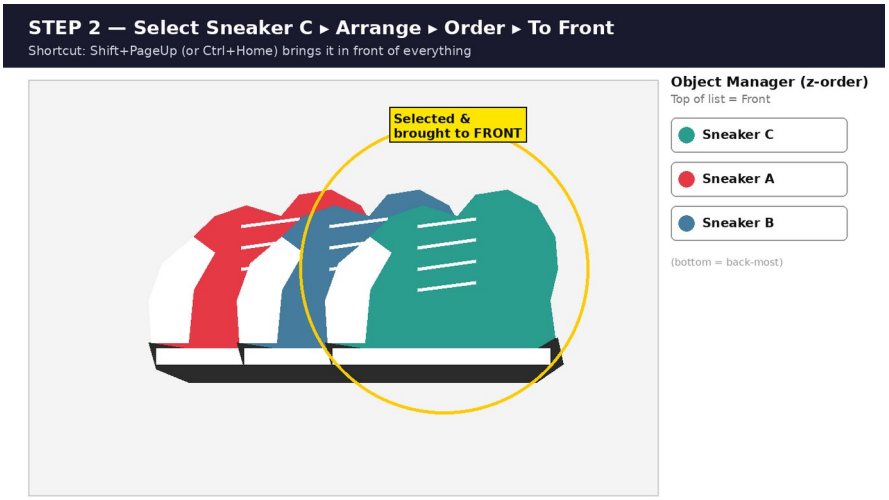

Fig 2 — Arrange ▸ Order ▸ To Front moves Sneaker C above both A and B — it is now the top-most item in the Object Manager.

Step 3 — Send the Same Sneaker to the Back

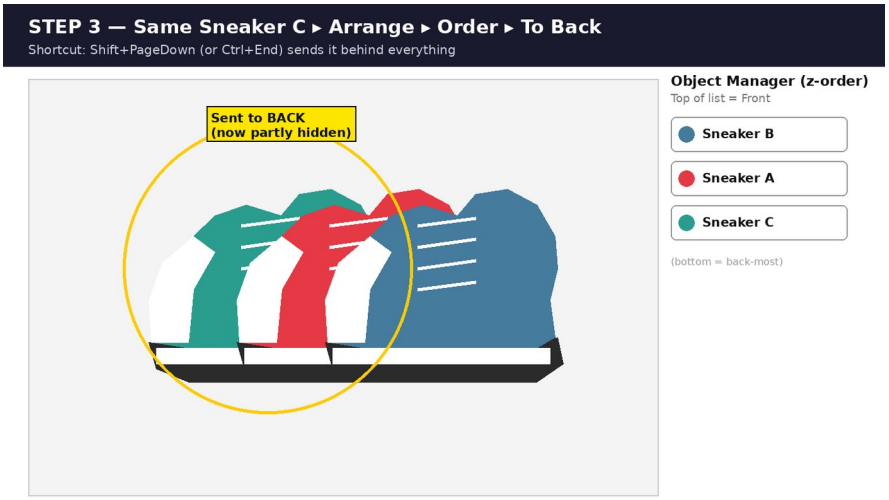

Fig 3 — Arrange ▸ Order ▸ To Back sends Sneaker C below both A and B — it drops to the bottom of the Object Manager list.

Step 4 — Verify the Change

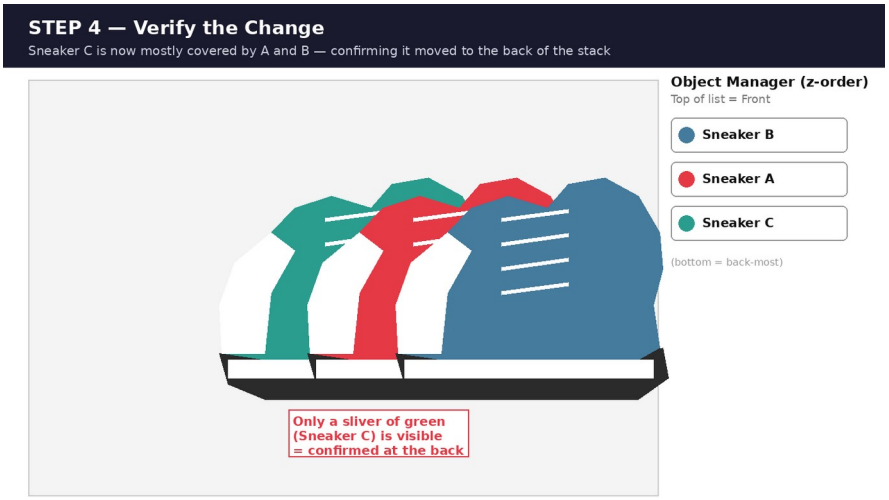

Fig 4 — Only a thin sliver of Sneaker C is now visible behind A and B, visually confirming it moved to the back of the stack — matching the Object Manager order.

Observation

- Arrange ▸ Order controls z-order (front-to-back stacking), completely independent of the sneakers' x/y position on the page.
- To Front / To Back move an object all the way to either end of the stack; Forward One / Back One nudge it past just one neighbouring object at a time.
- The Object Manager docker is the fastest way to verify a stacking change — its top-to-bottom list always mirrors what's visually in front or behind on the canvas.
